

Good People Are Not Enough

A collective does not
become collaborative
just because good people
are in the same room

Rizom is not a traditional team

- more freedom
- more emergence
- more possibility

More possibility, but also

- more ambiguity
- more invisibility
- more dependence on chance

Teams work because
people know
who knows what

In Rizom, too much stays invisible

- what someone brings
- what they are looking for
- what they are working on
- where collaboration might exist

The bottleneck is not talent.
The bottleneck is legibility

Rizom Brains can help the collective become more knowable to itself

Legibility first. Coordination next

- Brains make collaboration easier to see
- agent-to-agent interaction could make it easier to activate

The question is not
whether Rizom
has good people

The question is whether
collaboration can find us

What would make collaboration less accidental in Rizom?
